Summer Program 2006
June 19-July 14
The focus of the WET program is to provide science, mathematics, and technical enrichment activities centered on science and engineering to its participants. Every effort will be made to achieve these objectives through the participation of women who are professionals in science and/or engineering or who are pursuing a career in a technical discipline. Students will take classes designed to stimulate their interest in science, engineering, and mathematics. They will attend seminars and laboratory demonstrations conducted by female scientists and engineers. A panel of engineering students, representing the Society of Women Engineers (SWE), will dialogue with the WET participants regarding preparation for studying engineering. WET participants will work collaboratively on projects related to science, engineering and mathematics. Field trips are scheduled to further expose WET students to science and engineering. The program assembles an ethnically diverse group of 30 girls. New students are added to the existing class to satisfy attrition rates which may occur.

For an application please call 313-577-3813
